### Description

The VMM type valve is a combination of two solenoid valves in an only compact and versatile valve housing.  
This type of device is suitable for air or gas blocking and releasing controls (with one or two stages operation), required in gas power burners, atmospheric gas boiler, industrial kilns and others gas consuming appliances.

### Features

VMM valves are made of aluminum alloy die-cast, with a range for inlet/outlet connections from DN20 (3/4") up to DN80 (3").

Sealings are made of NBR-based rubber certified for use with gas (EN 549).

Pipe connections meet group 2 and backpressure sealing is compliant with class A, according to EN161 requirements.

A third valve with capacity of DN15 or DN25 can be fitted to by-pass the second one and have a low fire stage or a second outlet for pilot burner (pilot execution).

The normally open vent valve VMRNA can be integrated in VMM from 1"¼ to 3"; dimensions and piping are the same of third pilot valve. See VMRNA datasheet for other details.

Suitable for use with air and non-aggressive gases included in the 1, 2 and 3 families (EN 437). Special versions suitable for aggressive gases, free of brass and with FPM seals.

The whole range can be provided in Ex-proof execution, for use in Zones 2 and 22, according to 2014/34/EU Directive (ATEX).

The valve is open only when energized: if, for any reason, power supply goes down, the valve closes immediately (intrinsic safe).

Suitable for heavy-duty cycle operation and qualified for continuous service (100% ED).

Equipped with flow rate adjustment.

An incorporated fine mesh filter protects the valve seat and disc as well as downstream components and prevents dirty contamination.

A proof of closure switch or a visual indicator can be installed (see PCS-VI datasheet for details); in this case the valve has to be equipped with 1/8" connection on the bottom (optional). Models from 2"½-3" have this features as standard.

Provided with bilateral pressure ports on two sides in all pressure chambers, to connect manometers, pressure switches, leakage tester or other gas equipment.

The coils are provided with terminal box or with ISO 4400 plug.

All components are designed to withstand any mechanical, chemical and thermal condition occurring during typical service. Effective impregnation and surface treatments have been used to improve mechanical sturdiness, sealing and resistance to corrosion of the components.

Valves are 100% tested by computerized testing machineries and are fully warranted.

## Functioning and application

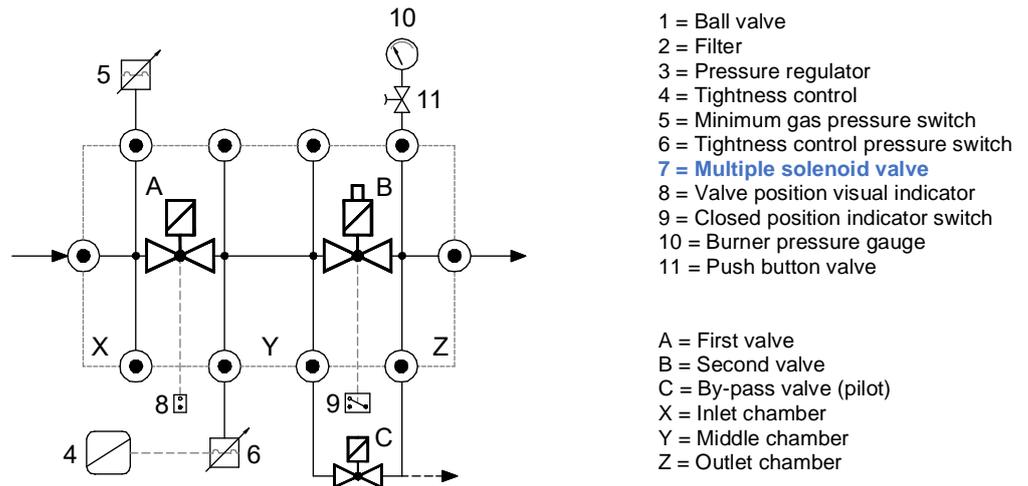

The VMM type valve is a safety shutting device using auxiliary power supply.

The first valve (A) is a fast-opening safety solenoid valve. When it is de-energized, the spring pushes on the seal disc, keeping the gas passage closed. In the inlet chamber there is the gas line pressure which forces on the disc, increasing the closing function and improving the seal. When the coil is powered, the valve opens rapidly against the strength of the spring and gas pressure.

If the power supply is shut off, the valve rapidly closes, interrupting the gas flow.

Equally, the second valve (B) may be a fast opening or a slow opening solenoid valve to adjust the gas flow, with a first adjustable fast stroke and a second adjustable slow stroke.

It is possible to connect a third by-pass valve (C), which works as low fire stage or to obtain a second fast (slow) stroke or both.

(The above scheme refers to size 1 "1/4"-2" with third valve as by-pass)

Fig.1

This kind of valve is normally installed as safety and regulating device in gas trains, for industrial applications and gas firing systems.

Figure 2 shows an example of installation.

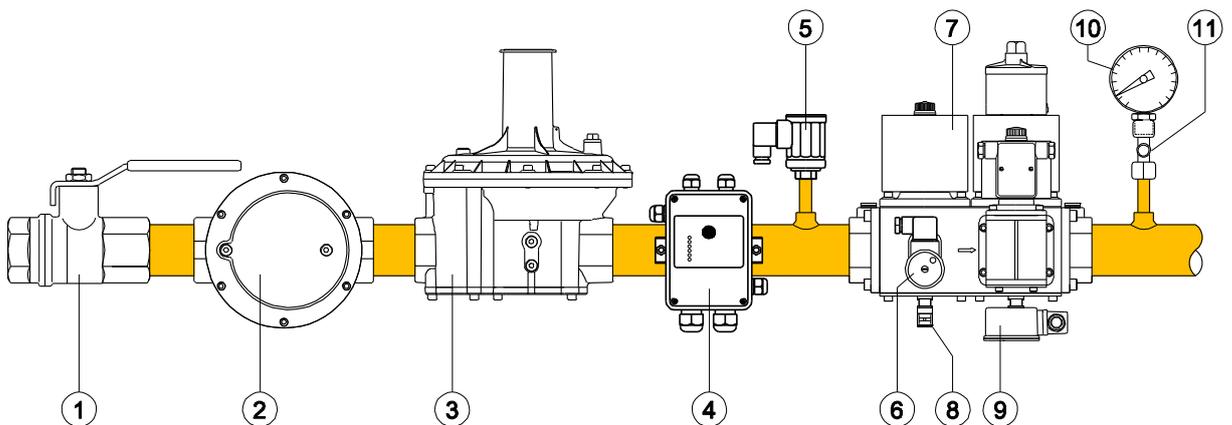

Fig.2

### Gas flow chart

(Pressure drop)

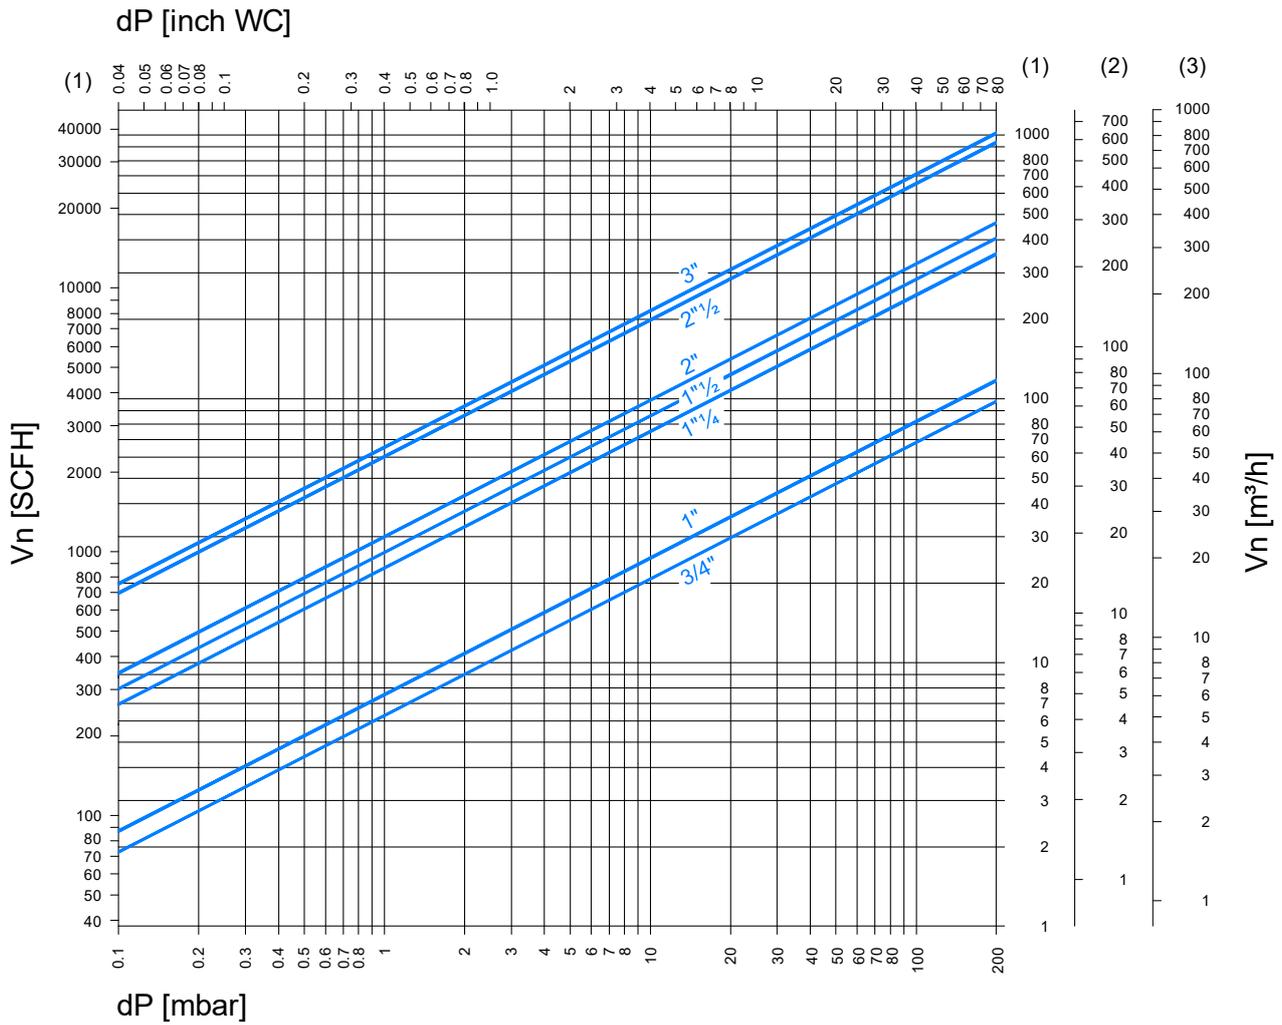

Fig. 4

### Formula of conversion from air to other gases

$$V_{GAS} = k \cdot V_{AIR}$$

$$k = \sqrt{\frac{\rho_{AIR}}{\rho_{GAS}}}$$

Tab. 3

Gas type	Density $\rho$ [Kg/m³]
(1) Natural gas	0,80
(2) LPG	2,00
(3) Air	1,225

15°C, 1013 mbar, dry

When the flow read on the diagram is referred to operating pressure instead of standard conditions, the pressure drop  $\Delta p$  read on the diagram must be multiplied for the factor: (1+ relative pressure in bar)

*Example:*

In the 2" solenoid valve with an air flow of 60 m<sup>3</sup>/h at standard conditions there is a pressure drop  $\Delta p = 6$  mbar.

If we consider that 60 m<sup>3</sup>/h is the flow at 200 mbar of inlet pressure, then the pressure drop to be consider is:

$$\Delta p = 6 \times (1 + 0,2) = 7,2 \text{ mbar}$$

Normally, pressure drop and flow rate for the valves are read from the gas flow diagram. However, the valves can also be chosen in accordance with the characteristic "Kvs value" which is shown below:

Tab. 4

	Kvs [m <sup>3</sup> /h]		
	Main valve	Bypass 1/2"	Bypass 1"
<b>3/4"</b>	6,0	4,6	-
<b>1"</b>	7,0	4,6	-
<b>1"¼</b>	21,5	6,0	9,0
<b>1"½</b>	25,0	6,0	9,0
<b>2"</b>	27,4	6,0	9,0
<b>DN65</b>	59,0	6,0	9,0
<b>DN80</b>	61,0	6,0	9,0

The selection of the valve requires the calculation of the Kv under the operating conditions.

Considering only subcritical pressure drops:

$$\Delta p < \frac{p_1}{2}$$

Kv can be calculated with the formula:

$$Kv = \frac{Vn}{514} \sqrt{\frac{\rho(t+273)}{\Delta p \cdot p_2}}$$

where

Vn = flow rate at standard conditions [m<sup>3</sup>/h]

Kv = flow factor [m<sup>3</sup>/h]

$\rho$  = density [Kg/m<sup>3</sup>]

p<sub>1</sub> = absolute inlet pressure [bar]

p<sub>2</sub> = absolute outlet pressure [bar]

$\Delta p$  = differential pressure p<sub>1</sub>-p<sub>2</sub> [bar]

t = media temperature [°C]

To the Kv value calculated from operating conditions we add an allowance of 20%, to obtain the minimum Kvs value which the valve should have:

**Kvs > 1,2 Kv**

Valve must be selected considering the following:

- Pressure drops  $\Delta p \leq 0,1 p_1$  are recommended and  $\Delta p > p_1/2$  are always unadvisable
- Flow velocities  $w \leq 15$  m/s are recommended and  $w > 50$  m/s are always unadvisable.

## Special versions and options

- **L:** valves with terminal box and size 3/4"-1" can be supplied with special electronic board which provides full power for the opening stage, then it switches to low power consumption for the holding stage (standard from 1"¼ to 3").
- **D:** the third valve can be fitted to have a separate line for a pilot burner.

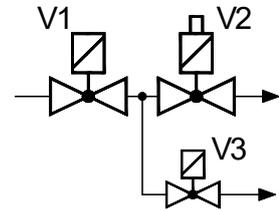

Fig.5

- **F:** 1"½ and 2" threaded versions can be supplied with a flanged connection, by means of a special kit.
- **P:** valves are available with proof-of-closure switch (POC), complying with NFPA 86 requirements. A factory adjusted SPDT switch inside an enclosure mounted on the bottom of the second valve, provides an electrical signal indicating valve position. A two-colored led gives also a visual indication of the valve position (Red = valve open, Green = valve closed).
- **J:** valves can be supplied in special version for aggressive gases such as biogas. They are free of brass and NBR. In this case customer shall check compatibility between valve materials and gas contents.
- **K:** valves can be supplied in special version for aggressive and dirty gases such as COG. They are free of brass and NBR and have additional protection of internal mechanism. As these gases usually have high content of hydrogen, tightness test is performed with helium. In this case customer shall check compatibility between valve materials and gas contents.
- **HF:** valves can be manufactured with additional treatment and tightness test with helium, so that they are suitable to be used with hydrogen.
- **Y:** valves can be provided with NPT threads or ANSI flanges instead of Rp thread or PN 16 flanges.
- **I:** valves can be provided with electrical connection made by a standard plug ISO 4400.
- **M:** valves from 3/4" to 2" can be equipped with G1/8 connection on the bottom to fit a closed position indicator switch (PCS) or visual indicator (VI) (standard from DN65 to DN80).
- **T:** valves can be provided with transparent cover and LED which lights up when electrical power is supplied.
- **T1:** valves can be provided with transparent cover to see LED light when coil is powered and connection with standard plug ISO 4400.
- **O:** enclosure class can be increased up to IP65. The valves will be provided with a sealed terminal box and cable set.
- **O1:** enclosure class of connection with standard plug ISO 4400 can be increased up to IP65 with additional sealing.
- **X:** valves can be provided with EX execution for use in Zones 2 and 22, according to 2014/34/EU Directive (ATEX):
 

category	II 3 G,D
protection mode	Ex ec IIA T4 Gc X or Ex ec IIB+H2 T4 Gc X (HF version) Ex tc IIIB T135°C Dc X or Ex tc IIIC T135°C Dc X (IP65 version)
ambient temperature	-15 / +40 °C
- **Z:** aluminum valves can be supplied with anodized housing and external components, to withstand aggressive environments.
- **Z1:** aluminum valves can be supplied with epoxy body coating and anodized inner components, to withstand aggressive gases.

## Design, installation and servicing

To assure a proper and safe operation, as well as a long service life of the valve, consider the following recommendations during the design of the system where the valve will be installed:

- ✓ Ensure that all the features of your system comply with the specifications of the valve (gas type, operating pressure, flow rate, ambient temperature, electrical voltage, etc.).
- ✓ Valve may be mounted with coil in horizontal or vertical position, not upside down. Coil may be oriented 360 degrees in any direction.
- ✓ In the event of vertical pipe, the flow direction should be from bottom to top.
- ✓ After removing the end caps make sure no foreign body will enter into the valve during handling or installation (e.g. swarf or excessive sealing agent).
- ✓ A gas filter should be always installed upstream the valve.
- ✓ Ensure that installing area is protected from rain and water splashes or drops.
- ✓ Perform leak and functional tests after mounting.
- ✓ The continuous service (100% ED) causes inevitable coil heating, depending on working environment. Never install the valve close to walls or other equipments. To improve the coil cooling, install the valve allowing free air circulation.
- ✓ Perform maintenance according to service instructions at least once a year (most often for aggressive gases).
- ✓ Due to seals aging, to ensure safe operation, we recommend the valve replacement after 10 years from the date of manufacture stamped on the product. The heavy cycle operation may reduce the expected lifetime.
- ✓ This control must be installed in compliance with the rules in force.
- ✓ Make sure all works are performed by qualified technicians only and in compliance with local and national codes.
- ✓ To prevent product damage and dangerous situations, read carefully the instructions supplied with the product before use.

For more details see the Installation and Service Instructions.

## Standards and approvals

The product complies with the essential requirements of the following European Directives and their amendments:

2016/426/EU (Gas Appliances Regulation)  
2014/34/EU (ATEX) when shown upon the product  
2014/30/EU (Electromagnetic Compatibility)  
2014/35/EU (Low Voltage Directive)  
2011/65/EU (RoHS II)

**CE-Reg.-No. 0063AQ1350**

The product complies with the Technical Regulations TP TC 004/2011-016/2011-020/2011-032/2013 of Russia, Belarus and Kazakhstan.

Declaration of Conformity: **№ RU Д-IT.PA01.B.08271/18**

The product is approved for Australia, certificate **GMK 10624** issued by IAPMO R&T Oceana on the basis of norm AS 4629.

The valves meet the requirements of functional safety of electrical systems according to the European standard IEC EN 61508 and are certified for systems up to SIL3.

Certificate No.: **TUV IT 22 SIL 0118**

The product (\*) is suitable for applications comply with NFPA 86 (Class 7400).  
Factory Mutual Approval Identification: **0003061781**

(\*) Notice: special version applies.

**Quality Management System is certified according to UNI EN ISO 9001.**
